Release Notes for ReaClassical 25.x

Ongoing Changelog: **https://github.com/chmaha/ReaClassical/commits/v25/**

Instructions for a new portable install:

1. Run the latest portable install as per the installation guide (it will create a new ReaClassical folder with a short year
   quarter suffix e.g. ReaClassical_25). Double-click on the REAPER binary inside the folder!

2. Follow the update instructions below to get the latest and greatest ReaClassical functions, toolbar and keymap.

Instructions to update a ReaClassical portable install:

1. Run the ReaClassical_Updater function found in the actions dialog (or use the shortcut shift+U). This will sync ReaPack to get the latest ReaClassical functions then offer to overwrite your toolbars and keymaps with the latest ReaClassical portable install defaults. **DON'T answer yes to either of these questions if you have your own custom toolbars or keyboard shortcuts as they will be overwritten!**

2. Run the REAPER Update Utility (Ctrl+U) to upgrade to the latest tested version of REAPER as noted here.

ReaClassical Core: Basic manual install of just the S-D editing tools inside your existing REAPER Install

To just use the S-D editing functions and my jsfx plugins without any customization of keymaps, toolbar etc:

1. Install both ReaPack (https://reapack.com/) and latest SWS Extensions (https://www.sws-extension.org/download/pre-release/) if you haven't already

2. Import my repository into ReaPack by copying and pasting this link. If you need help with importing see https://reapack.com/user-guide#import-repositories.

3. Search for "ReaClassical Core" and install the metapackage and any jsfx plugins (my "RCPlugs" are highly recommended for classical work).

4. Set up keyboard shortcuts in the actions list (? shortcut) as desired.
